**Section A** (Correct answer – 2 points | No answer – 0 points | Incorrect answer – minus 1 point)

**Question 1**

Find the value of the following.

$$2020 \times 999 - 9999 \times 202 + 9999$$

- A. 8181
- B. 2020
- C. -1818
- D. 4047777
- E. None of the above

**Question 2**

How many digits are there in  $5^{2020} \times 4^{1008}$ ?

- A. 2020
- B. 1008
- C. 2016
- D. 2019
- E. None of the above

**Question 3**

A standard 6-sided dice is rolled twice. Which of the following events has the highest probability of occurrence?

- A. The second number is twice the first.
- B. The second number is not greater than the first.
- C. At least one number is greater than 3.
- D. The sum of two numbers is a prime number.
- E. None of the above

**Question 4**

Each of six countries brought a team of 5 players to a tennis tournament. Each pair of players from different countries played once. How many games were there in the tournament?

- A. 250
- B. 360
- C. 375
- D. 480
- E. None of the above

**Question 5**

A “Nicely Seven” is a two-digit positive integer such that it has only two factors and the sum of the factors is a multiple of 7. How many Nicely Seven numbers are there?

- A. 8
- B. 13
- C. 3
- D. 4
- E. None of the above

**Question 6**

Given that  $a = 4^{\frac{1}{3}} - 2^{\frac{1}{3}} + 1$ , what is the value of  $\left(\frac{3-a}{a}\right)^6$ ?

- A. 4
- B. 2
- C. 64
- D.  $\left(4^{\frac{1}{3}} - 2^{\frac{1}{3}}\right)^2$
- E. None of the above

**Question 7**

Find the greatest prime number  $x$  which satisfies the following inequality.

$$\left|\frac{1}{57-x}\right| < \frac{5}{x^2}$$

- A. 13
- B. 11
- C. 59
- D. 61
- E. None of the above

**Question 8**

The number 4 can be expressed as the sum of the digits 1 or 2 in five different ways as shown below.

$$4 = 1 + 1 + 1 + 1$$

$$4 = 1 + 1 + 2$$

$$4 = 1 + 2 + 1$$

$$4 = 2 + 1 + 1$$

$$4 = 2 + 2$$

How many ways can the number 9 be expressed as the sum of the digits 1 or 2?

- A. 60
- B. 55
- C. 45
- D. 40
- E. None of the above

**Question 9**

In the diagram, points  $E$  and  $D$  are on the sides  $AC$  and  $BC$  such that  $AE = \frac{1}{3}AC$  and  $BD = \frac{1}{3}BC$ . What is the ratio of the area of triangle  $AEF$  to the area of triangle  $ABC$ ?

- A.  $\frac{2}{7}$
- B.  $\frac{2}{9}$
- C.  $\frac{2}{13}$
- D.  $\frac{2}{15}$
- E. None of the above

**Question 10**

Dennis wrote down all the 3-digit numbers in increasing order on a piece of paper. He used a red pen to write down the even numbers and a blue pen to write down the odd numbers. How many red digits '6' are there on the piece of paper?

- A. 185
- B. 195
- C. 280
- D. 900
- E. None of the above

**Question 11**

It is given that  $a, b$ , and  $c$  are real numbers that satisfy the following equations.

$$\begin{cases} \frac{ab}{a+b} = 4 \\ \frac{bc}{b+c} = 6 \\ \frac{ac}{a+c} = 12 \end{cases}$$

What is the value of  $\frac{abc}{ab+bc+ac}$ ?

- A. 20
- B. 2
- C. 4
- D.  $\frac{1}{4}$
- E. None of the above

**Question 12**

How many pairs of two-digit positive integers  $a$  and  $b$  are there such that  $a^2 + b^2 = 2020$ ?

- A. 0
- B. 1
- C. 2
- D. 4
- E. None of the above

**Question 13**

In the figure below, the circle is centred at  $A$ . The segments  $BE$  and  $BF$  are tangents to the circle. Point  $C$  is on  $AB$  and on the circumference of the circle as shown. Point  $D$  is a point on  $BE$  such that  $CD$  is perpendicular to  $BE$ . If  $BE = 12$  and  $BC = 8$ , find the length of  $CD$ .

- A.  $\frac{25}{13}$
- B.  $\frac{24}{13}$
- C.  $\frac{40}{13}$
- D.  $\frac{12}{5}$
- E. None of the above

**Question 14**

Diana, Alexa, Jason, Tom and Michael are Secondary 2 or 4 students. They study in either Silver Oak Secondary School or Grand Mountain Secondary School. It is also given that:

- Tom and Michael are from different schools.
- Diana and Jason go to the same school.
- Three students go to Silver Oak Secondary School and the other two are from Grand Mountain Secondary School.
- Alexa and Michael are from the same grade.
- Jason and Tom study at different levels.
- Three students study in Secondary 2 and the other two students in Secondary 4.

If one of them is Secondary 4 student from Grand Mountain Secondary School, who is that person?

- A. Diana
- B. Alexa
- C. Jason
- D. Tom
- E. Michael

**Question 15**

Thirty identical marbles are to be distributed to 6 boys. Each boy gets at least 3 marbles. How many ways are there to distribute the marbles to the boys?

- A. 6188
- B. 15625
- C. 118755
- D.  $\frac{30!}{6}$
- E. None of the above

**Section B (Correct answer – 4 points | Incorrect or No answer – 0 points)**

When an answer is a 1-digit number, shade "0" for the tens, hundreds and thousands place.

*Example: if the answer is 7, then shade 0007*

When an answer is a 2-digit number, shade "0" for the hundreds and thousands place.

*Example: if the answer is 23, then shade 0023*

When an answer is a 3-digit number, shade "0" for the thousands place.

*Example: if the answer is 785, then shade 0785*

When an answer is a 4-digit number, shade as it is.

*Example: if the answer is 4196, then shade 4196*

**Question 16**

Find the largest 4-digit multiple of 25 whose sum and product of its digits are both multiples of 25.

**Question 17**

What is the value of the following expression?

$$\frac{3 \times 111.111}{6 \times 1.001} + \frac{3 \times 222.222}{6 \times 2.002} + \frac{3 \times 333.333}{6 \times 3.003} + \cdots + \frac{3 \times 666.666}{6 \times 6.006}$$

**Question 18**

The six-digit number 21A3B8 is divisible by 33. Find the value of  $A + B$ .

**Question 19**

In the diagram,  $\angle ABC = 90^\circ$  and  $DEFG$  is a square. If  $AE = 8$  and  $EF = 12$ , find the area of quadrilateral  $ACGD$ .

**Question 20**

What is the greatest 2-digit number that can be written as the sum of 2 different prime numbers in exactly 2 different ways?

**Question 21**

What is the smallest positive integer that has exactly six odd divisors and 12 even divisors?

**Question 22**

If  $(x^2 + 1)(y^2 + 1) + 9 = 6(x + y)$ , find the value of  $x^2 + y^2$ .

**Question 23**

What is the least number of weights required to weigh any objects of integer number of grams from 1 to 35 grams? The weights must be in integer number of grams.

**Question 24**

In the following cryptarithm, all the different letters stand for different digits.

$$\begin{array}{rcccccc} & C & I & R & C & L & E \\ & C & I & R & C & L & E \\ + & C & I & R & C & L & E \\ \hline S & P & H & E & R & E & \end{array}$$

Find the value of the sum  $C + I + R + C + L + E$ .

**Question 25**

Peter has seven different books of different subjects to be placed on a single-decked shelf. He does not want to place the Physics book next to the Biology one and the Geometry book next to the Chemistry one. In how many ways can he place all his books?

**END OF PAPER**

## Solutions to SASMO 2020 Secondary 4 (Grade 10)

### Question 1

$$2020 \times 999 - 9999 \times 202 + 9999 = 202 \times (9990 - 9999) + 9999 = 9999 - 202 \times 9 \\ = 8181$$

Answer: (A)

### Question 2

$$5^{2020} \times 4^{1008} = 5^{2020} \times (2^2)^{1008} = 5^{2020} \times 2^{2016} = 5^4 \times (5 \times 2)^{2016} = 625 \times 10^{2016}$$

$625 \times 10^{2016}$  has  $3 + 2016 = 2019$  digits.

Answer: (D)

### Question 3

Probability(an event) = (# of ways an event can happen) / (Total number of outcomes)

The total number of outcomes when a standard 6-sided dice is rolled twice is  $6 \times 6 = 36$ .

Find the probability for options A to D:

- A. The number of ways option A can happen is 3: (1, 2), (2, 4) and (3, 6).  $P(A)=3/36$ .
- B. The number of ways option B can happen is 21: (1, 1), (2, 1), (2, 2), (3, 1), ..., (6, 6).  $P(B)=21/36$ .
- C. The number of ways when both numbers are less than 4 is 9: (1, 1), (1, 2), (1, 3), (2, 1), ..., (3, 3).  $P(C)=1 - \frac{9}{36} = \frac{27}{36}$ .
- D. The number of ways option D can happen is 15: (1, 1), (1, 2), (1, 4), (1, 6), ..., (6, 5).  $P(D)=15/36$ .

Option **C** has the highest probability of occurrence.

Answer: (C)

**Question 4**

There are  $6 \times 5 = 30$  players in total. If all 30 players played with each other, then the total number of games would be  $30 \times 29 \div 2 = 435$ . However, the number of games between players from the same country is  $5 \times 4 \div 2 = 10$ . Thus, the number of games in the tournament was  $435 - 6 \times 10 = 375$ .

Answer: **(C)**

**Question 5**

A Nicely Seven number must be a prime number. Let  $a$  be a Nicely Seven number, then  $a$  and 1 are its factors and  $a + 1$  is a multiple of 7.

List down all two-digit multiples of 7, then subtract 1 from them and check whether the results are prime numbers:

|    |    |    |      |    |      |    |      |    |      |    |      |    |
|----|----|----|------|----|------|----|------|----|------|----|------|----|
| 14 | 21 | 28 | 35   | 42 | 49   | 56 | 63   | 70 | 77   | 84 | 91   | 98 |
| 13 | 20 | 27 | even | 41 | even | 55 | even | 69 | even | 83 | even | 97 |

Thus, there are **4** Nicely Seven numbers.

Answer: **(D)**

**Question 6**

$$\left(2^{\frac{1}{3}}\right)^3 + 1^3 = \left(2^{\frac{1}{3}} + 1\right) \times \left(4^{\frac{1}{3}} - 2^{\frac{1}{3}} + 1\right) \Leftrightarrow 3 = \left(2^{\frac{1}{3}} + 1\right) \times a \Leftrightarrow$$
$$\frac{3}{a} - 1 = 2^{\frac{1}{3}} \Leftrightarrow \frac{3-a}{a} = 2^{\frac{1}{3}} \Leftrightarrow \left(\frac{3-a}{a}\right)^6 = \left(2^{\frac{1}{3}}\right)^6 = 4$$

Answer: **(A)**

**Question 7***Case 1:  $x > 57$* 

$$\left| \frac{1}{57-x} \right| < \frac{5}{x^2} \Leftrightarrow \frac{1}{x-57} < \frac{5}{x^2} \Leftrightarrow x^2 - 5x + 285 < 0$$

The inequality  $x^2 - 5x + 285 < 0$  does not have any solutions.

*Case 2:  $x < 57$* 

$$\left| \frac{1}{57-x} \right| < \frac{5}{x^2} \Leftrightarrow \frac{1}{57-x} < \frac{5}{x^2} \Leftrightarrow x^2 + 5x - 285 < 0$$

The solution of the inequality  $x^2 + 5x - 285 < 0$  is

$$\frac{1}{2}(-5 - \sqrt{1165}) < x < \frac{1}{2}(\sqrt{1165} - 5).$$

The largest possible value of  $x$  is **13**.

Answer: **(A)**

**Question 8**

Count by the number of 2s in the sum as shown in the table below.

| Number of 2s              | Number of 1s | Number of ways |
|---------------------------|--------------|----------------|
| 4                         | 1            | 5              |
| 3                         | 3            | 20             |
| 2                         | 5            | 21             |
| 1                         | 7            | 8              |
| 0                         | 9            | 1              |
| The total number of ways: |              | 55             |

Answer: **(B)**

**Question 9**

Since  $AE:EC = 1:2$ , then  $Area(AEF):Area(CEF) = 1:2$  and  $Area(AEB):Area(CEB) = 1:2$ .

Similarly,  $Area(BDA):Area(CDA) = 1:2$  and  $Area(BDF):Area(CDF) = 1:2$ .

Let  $Area(AEF) = a$  and  $Area(BDF) = b$ , then  $Area(CEF) = 2a$  and  $Area(CDF) = 2b$ .

From  $Area(AEB):Area(CEB) = 1:2$ , we get  $Area(AFB) = 1.5a$

From  $Area(BDA):Area(CDA) = 1:2$ , we get  $Area(AFB) = 1.5b$ . Hence  $a = b$ ,  $Area(ABC) = 7.5a$  and  $Area(AEF):Area(ABC) = a:7.5a = \frac{2}{15}$ .

Answer: (D)

**Question 10**

Count the number of '6's in hundreds place:

When the hundreds place is 6, there are 10 options (0, 1, 2, ..., 9) for tens place and 5 options (0, 2, 4, 6, 8) for ones place. There are  $10 \times 5 = 50$  sixes in hundreds place.

Count the number of '6's in tens place:

When the tens place is 6, there are 9 options (1, 2, ..., 9) for hundreds place and 5 options (0, 2, 4, 6, 8) for ones place. There are  $9 \times 5 = 45$  sixes in tens place.

Count the number of '6's in ones place:

When the ones place is 6, there are 9 options (1, 2, ..., 9) for hundreds place and 10 options (0, 1, 2, ..., 9) for tens place. There are  $9 \times 10 = 90$  sixes in tens place.

There are  $50 + 45 + 90 = 185$  **red digits** '6' on the piece of paper.

Answer: (A)

**Question 11**

From the first equation:

$$\frac{ab}{a+b} = 4 \Leftrightarrow \frac{1}{4} = \frac{(a+b)}{ab} = \frac{1}{b} + \frac{1}{a}$$

Similarly, we get  $\frac{1}{6} = \frac{1}{b} + \frac{1}{c}$  and  $\frac{1}{12} = \frac{1}{c} + \frac{1}{a}$

Adding the 3 equations, we get

$$\frac{1}{a} + \frac{1}{b} + \frac{1}{c} = \frac{1}{2} \times \left( \frac{1}{4} + \frac{1}{6} + \frac{1}{12} \right) = \frac{1}{4}$$

Then

$$\frac{abc}{ab+bc+ac} = \frac{1}{\frac{ab+bc+ac}{abc}} = \frac{1}{\frac{1}{a} + \frac{1}{b} + \frac{1}{c}} = \frac{1}{\frac{1}{4}} = 4$$

Answer: (C)

**Question 12**

If  $a$  and  $b$  are odd numbers, then  $a^2$  and  $b^2$  give remainder 1 on division by 4 and the sum  $a^2 + b^2$  gives remainder 2 on division by 4. However, 2020 gives remainder 0 on division by 4. Hence  $a$  and  $b$  are even numbers.

Let  $a = 2x$  and  $b = 2y$  and rewrite the original equation:

$$(2x)^2 + (2y)^2 = 2020 \Leftrightarrow x^2 + y^2 = 505 \quad (1)$$

Obviously,  $x$  and  $y$  must have different parities.

If  $x$  is an even number, then only  $x = 8$  and  $x = 12$  satisfy the equation (1). Since the equation (1) is symmetric, then there are 4 solution pairs of  $(x, y)$  or **4 pairs** of  $(a, b)$ :  $(42, 16)$ ,  $(38, 24)$ ,  $(24, 38)$  and  $(16, 42)$ .

Answer: (D)

**Question 13**

Since the segment  $BE$  is tangent to the circle, then  $AE$  is perpendicular to  $BE$  and  $AEB$  and  $CDB$  are similar triangles.

Let  $AE = AC = r$ , then by Pythagoras Theorem in triangle  $AEB$ :

$$AE^2 + BE^2 = AB^2 \Leftrightarrow r^2 + 12^2 = (r + 8)^2$$

Solving the equation, we get  $r = 5$  and  $AB = 13$ .

From similar triangles  $AEB$  and  $CDB$ :

$$\frac{AE}{AB} = \frac{CD}{BC} \Leftrightarrow \frac{5}{13} = \frac{CD}{8} \Leftrightarrow CD = \frac{40}{13}$$

Answer: **(C)**

**Question 14**

If Diana and Jason go to Grand Mountain Secondary School, then neither Tom nor Michael goes to Grand Mountain Secondary School. Hence Tom and Michael go to Silver Oak Secondary School which is impossible. Thus, Diana and Jason go to Silver Oak Secondary School.

If Alexa and Michael are Secondary 4 students, then neither Tom nor Jason is a Secondary 4 student. Hence Jason and Tom are Secondary 2 students which is impossible. Thus, Alexa and Michael are Secondary 2 students.

Diana, Jason, Alexa and Michael cannot be Secondary 4 student from Grand Mountain Secondary School. Thus, the answer is **Tom**.

Answer: **(D)**

**Question 15**

Let  $a_1, a_2, \dots, a_6$  be the number of marbles given to each of the 6 boys. Then  $a_1 \geq 3, a_2 \geq 3, \dots, a_6 \geq 3$  and rewrite  $a_1 = b_1 + 2, a_2 = b_2 + 2, \dots, a_6 = b_6 + 2$  where  $b_1 \geq 1, b_2 \geq 1, \dots, b_6 \geq 1$ .

It is given that

$$(b_1 + 2) + (b_2 + 2) + \dots + (b_6 + 2) = 30 \Leftrightarrow b_1 + b_2 + \dots + b_6 = 18$$

The number of solutions for the above equation is  $C(17, 5) = \binom{17}{5} = \frac{17!}{5! \times (17-5)!} = 6188$ .

Answer: **(A)**

**Question 16**

The largest possible sum of the digits of a 4-digit number is  $9 \times 4 = 36$ . Since the sum of digits is a multiple of 25, then the sum of the digits must be 25. The last 2 digits must be 00, 25, 50 or 75.

Case 1:

If the last 2 digits are 00, then the sum of the digits is at most 18 which is impossible.

Case 2:

If the last 2 digits are 25, then the sum of the hundreds and thousands digits is 18. However,  $9 \times 9 \times 2 \times 5$  is not a multiple of 25.

Case 3:

If the last 2 digits are 50, then the sum of the digits is at most 23 which is impossible.

Case 4:

If the last 2 digits are 75, then the sum of the hundreds and thousands digits is 13. For the product to be a multiple of 25, the hundreds or thousands digit must be 5. Thus, the largest possible 4-digit number is **8575**.

Answer: **8575**

**Question 17**

$$\begin{aligned} & \frac{3 \times 111.111}{6 \times 1.001} + \frac{3 \times 222.222}{6 \times 2.002} + \cdots + \frac{3 \times 666.666}{6 \times 6.006} = \\ & \frac{3 \times 111 \times 1.001}{2 \times 3 \times 1.001} + \frac{3 \times 222 \times 1.001}{2 \times 3 \times 2.002} + \cdots + \frac{3 \times 666 \times 1.001}{2 \times 3 \times 6.006} = \\ & \frac{111}{2} + \frac{111}{2} + \cdots + \frac{111}{2} = \frac{666}{2} = \mathbf{333} \end{aligned}$$

Answer: **333**

**Question 18**

The six-digit number 21A3B8 is divisible by 3 and 11.

From the Divisibility Rule of 11:

$|(2 + A + B) - (1 + 3 + 8)| = |A + B - 10|$  must be divisible by 11. Hence  $A + B = 10$ .

Answer: **10**

**Question 19**

$$\angle ADE = 90^\circ - \angle EAD = 90^\circ - \angle CAB = \angle BCA = \angle GCF$$

$$\angle EAD = 90^\circ - \angle ADE = 90^\circ - \angle GCF = \angle FGC$$

Thus, triangles  $AED$  and  $GFC$  are similar and

$$\frac{AE}{DE} = \frac{GF}{FC} \Leftrightarrow \frac{8}{12} = \frac{12}{FC} \Leftrightarrow FC = 18.$$

Quadrilateral  $ACGD$  is trapezium and its area is

$$DE \times \frac{(GD + AC)}{2} = 12 \times \frac{(12 + 38)}{2} = \mathbf{300}.$$

Answer: **300**

**Question 20**

Clearly, the desired 2-digit number must be an even number. The numbers 98, 96, 94, ..., 72, 70 can be written as the sum of 2 different prime numbers in more than 2 different ways. For example,

|           |         |         |         |
|-----------|---------|---------|---------|
| <b>98</b> | 79 + 19 | 31 + 67 | 37 + 61 |
| <b>96</b> | 7 + 89  | 13 + 83 | 17 + 79 |
| <b>94</b> | 5 + 89  | 11 + 83 | 23 + 71 |
| ...       |         |         |         |

The greatest 2-digit number that can be written as the sum of 2 different prime numbers in exactly 2 different ways is **68** = 31 + 37 = 7 + 61.

Answer: **68**

**Question 21**

The number must have  $6 + 12 = 18$  divisors. Then its prime factorisation must be  $p^2 \times q^2 \times r$ ,  $p \times q^8$ ,  $p^2 \times q^5$  or  $p^{17}$ . Since the number has exactly 6 odd divisors, then its prime factorisation must be  $p^2 \times q^2 \times r$  or  $p^2 \times q^5$ . The smallest such number is  $2^2 \times 3^2 \times 5 = 180$ .

Answer: **180**

**Question 22**

$$x^2 + y^2 + x^2y^2 + 10 - 6x - 6y = 0 \Leftrightarrow$$

$$x^2 + y^2 + x^2y^2 + 10 - 6x - 6y + 2xy - 2xy = 0 \Leftrightarrow$$

$$x^2y^2 - 2xy + 1 + x^2 + 2xy + y^2 - 6(x + y) + 9 = 0 \Leftrightarrow$$

$$(xy - 1)^2 + (x + y)^2 - 6(x + y) + 9 = 0 \Leftrightarrow$$

$$(xy - 1)^2 + [(x + y) - 3]^2 = 0$$

Hence  $xy = 1$ ,  $x + y = 3$  and

$$3^2 - 2 \times 1 = (x + y)^2 - 2xy = x^2 + y^2 = 7.$$

Answer: **7**

**Question 23**

To get the least number of weights, we need to put the weights on both sides of a scale.

To weigh 1 g object, we need 1 g weights.

To weigh 2 g object, we need 2 or 3 g weights.

To weigh 5 g and 14 g objects, we need at least 2 more weights. Thus, the least number of weights is **4** and the weights are 1 g, 3 g, 9 g and 27 g. For example,

$5 \text{ g} = 9 \text{ g} - 3 \text{ g} - 1 \text{ g}$ ,  $14 \text{ g} = 27 \text{ g} - 9 \text{ g} - 3 \text{ g} - 1 \text{ g}$  and  $35 \text{ g} = 27 \text{ g} + 9 \text{ g} - 1 \text{ g}$ .

Answer: **4**

**Question 24**

Rewrite the sum as the product:

$$\begin{array}{r}
 \text{C} \quad \text{I} \quad \text{R} \quad \text{C} \quad \text{L} \quad \text{E} \\
 \times \phantom{\text{S} \quad \text{P} \quad \text{H} \quad \text{E} \quad \text{R} \quad \text{E}} \\
 \hline
 \text{S} \quad \text{P} \quad \text{H} \quad \text{E} \quad \text{R} \quad \text{E} \\
 \hline
 \end{array}$$

In ones place, the letter E must be 5. (E=0 can be checked similarly, and it doesn't lead to any solution.)

The six-digit number CIRCLE times 3 results in a 6-digit number, therefore C=1, 2 or 3.

If C=3, then in hundreds place product  $C \times 3$ , there must be a carry over of 6 from tens place product which is impossible.

If C=2, then in hundreds place product  $C \times 3$ , there must be a carry over of 9 from tens place product which is impossible. Hence C=1.

In hundreds place product  $C \times 3$ , there must be a carry over of 2 from tens place product which implies that L=8 or 9.

If L=8, then R=5=E which is impossible. Hence L=9, R=8 and H=4.

In hundred thousands place product, S cannot be 4 and 5 since H=4 and E=5. Hence S=3 and the only one-digit number left for I is 0.

The value of the sum  $C + I + R + C + L + E$  is  $1 + 0 + 8 + 1 + 9 + 5 = 24$ .

Answer: **24**

**Question 25**

The total number of ways to place all his books without any restrictions is  $7! = 5040$ .

The number of ways when the Physics book is next to the Biology book and Geometry is next to the Chemistry one is  $5! \times 2 \times 2 = 480$ .

Hence, the number of ways when the Physics book is not next to the Biology book and Geometry is not next to the Chemistry one is  $5040 - 480 = 4560$ .

Answer: **4560**
